CSI

Overview

The Center for Innovation Simulation (CSI) provides a setting in which clinical competencies can be practiced and demonstrated using low, mid or high-fidelity simulation activities. The CSI is an extension of the didactic classroom and clinical healthcare setting, providing a safe teaching/learning space where students can put into practice the newly learned principles and techniques essential for quality nursing care. The CSI is where students continue to evolve as they apply both cognitive and kinesthetic learning objectives related to their stated nursing curriculum. The positionality of the CSI in terms of pedagogy is the student is not expected to have perfected techniques learned in a single episodic encounter, but instead should be given the opportunity to have access during class and personal study time to practice. The goal for proficiency and/or perfection of the required nursing skills is attained through repetitive practice with guidance and facilitation from the faculty, staff, and teacher assistants in both the clinical space and the CSI.
